1   Introduction

This document describes the specification of the blockcipher CLEFIA. CLEFIA is a 128-bit blockcipher with its key length being 128, 192 and 256 bits, which is compatible to AES. CLEFIA consists of two parts: a data processing part and a key scheduling part. CLEFIA employs a generalized Feistel structure with four data lines, and the width of each data line is 32 bits. Additionally, there are key whitening parts at the beginning and the end of the cipher. The numbers of rounds of CLEFIA are 18, 22 and 26 for 128-bit, 192-bit and 256-bit keys, respectively.

2   Notations

This section describes mathematical notations, conventions and symbols used throughout this paper.

$\mathtt{0x}$	:	A prefix for a binary string in a hexadecimal form
$a_{(b)}$	:	b denotes the bit length of a
$a\|b$ or $(a\|b)$	:	Concatenation
$(a,\ b)$ or $(a\ b)$	:	Vector style representation of $a\|b$
$a \leftarrow b$	:	Updating a value of a by a value of b
${}^t a$	:	Transposition of a vector or a matrix a
$a \oplus b$	:	Bitwise exclusive-OR. Addition in $\mathrm{GF}(2^n)$
$a \cdot b$	:	Multiplication in $\mathrm{GF}(2^n)$
$\overline{a}$	:	Logical negation
$a \lll b$	:	b-bit left cyclic shift operation
$\mathbf{w_b}(a)$	:	For an $8n$-bit string $a = a_0\|a_1\|\ldots\|a_{n-1}$, $a_i \in \{0,1\}^8$, $\mathbf{w_b}(a)$ denotes the number of non-zero a_is.

3   Definition of $GFN_{d,r}$

We first define a function $GFN_{d,r}$ which is a fundamental structure for CLE-FIA, followed by definitions of a data processing part and a key scheduling part.

CLEFIA uses a 4-branch and an 8-branch generalized Feistel network. We denote d-branch r-round generalized Feistel network employed in CLE-FIA as $GFN_{d,r}$. $GFN_{d,r}$ uses two different 32-bit F-functions F_0 and F_1 whose input/output are defined as follows.

$$F_0, F_1 : \left\{ \begin{array}{ccc} \{0,1\}^{32} \times \{0,1\}^{32} & \to & \{0,1\}^{32} \\ (RK_{(32)}, x_{(32)}) & \mapsto & y_{(32)} \end{array} \right.$$

For d 32-bit input X_i and output Y_i $(0 \le i < d)$, and $dr/2$ 32-bit round keys RK_i $(0 \le i < dr/2)$, $GFN_{d,r}$ $(d = 4, 8)$ are defined as follows.

$$GFN_{4,r} : \left\{ \begin{array}{l} \{\{0,1\}^{32}\}^{2r} \times \{\{0,1\}^{32}\}^4 \to \{\{0,1\}^{32}\}^4 \\ (RK_{0(32)}, \ldots, RK_{2r-1(32)}, X_{0(32)}, \ldots, X_{3(32)}) \mapsto Y_{0(32)}, \ldots, Y_{3(32)} \end{array} \right.$$

Step 1. $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow X_0 \mid X_1 \mid X_2 \mid X_3$
Step 2.   For $i = 0$ to $r - 1$ do the following:
 Step 2.1 $T_1 \leftarrow T_1 \oplus F_0(RK_{2i}, T_0)$,
   $T_3 \leftarrow T_3 \oplus F_1(RK_{2i+1}, T_2)$
  Step 2.2 $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow T_1 \mid T_2 \mid T_3 \mid T_0$
Step 3. $Y_0 \mid Y_1 \mid Y_2 \mid Y_3 \leftarrow T_3 \mid T_0 \mid T_1 \mid T_2$

$$GFN_{8,r} : \left\{ \begin{array}{l} \{\{0,1\}^{32}\}^{4r} \times \{\{0,1\}^{32}\}^8 \to \{\{0,1\}^{32}\}^8 \\ (RK_{0(32)}, \ldots, RK_{4r-1(32)}, X_{0(32)}, \ldots, X_{7(32)}) \mapsto Y_{0(32)}, \ldots, Y_{7(32)} \end{array} \right.$$

Step 1. $T_0 \mid T_1 \mid \ldots \mid T_7 \leftarrow X_0 \mid X_1 \mid \ldots \mid X_7$
Step 2.   For $i = 0$ to $r - 1$ do the following:
 Step 2.1 $T_1 \leftarrow T_1 \oplus F_0(RK_{4i}, T_0)$,
   $T_3 \leftarrow T_3 \oplus F_1(RK_{4i+1}, T_2)$,
   $T_5 \leftarrow T_5 \oplus F_0(RK_{4i+2}, T_4)$,
   $T_7 \leftarrow T_7 \oplus F_1(RK_{4i+3}, T_6)$
  Step 2.2 $T_0 \mid T_1 \mid \ldots \mid T_6 \mid T_7 \leftarrow T_1 \mid T_2 \mid \ldots \mid T_7 \mid T_0$
Step 3. $Y_0 \mid Y_1 \mid \ldots \mid Y_6 \mid Y_7 \leftarrow T_7 \mid T_0 \mid \ldots \mid T_5 \mid T_6$

The inverse function $GFN_{4,r}^{-1}$ is obtained by changing the order of RK_i and the direction of word rotation at Step 2.2 and Step 3.

$$GFN_{4,r}^{-1} : \left\{ \begin{array}{l} \{\{0,1\}^{32}\}^{2r} \times \{\{0,1\}^{32}\}^4 \to \{\{0,1\}^{32}\}^4 \\ (RK_{0(32)}, \ldots, RK_{2r-1(32)}, X_{0(32)}, \ldots, X_{3(32)}) \mapsto Y_{0(32)}, \ldots, Y_{3(32)} \end{array} \right.$$

> *Step 1.* $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow X_0 \mid X_1 \mid X_2 \mid X_3$
> *Step 2.* For $i = 0$ to $r - 1$ do the following:
>   *Step 2.1* $T_1 \leftarrow T_1 \oplus F_0(RK_{2(r-i)-2}, T_0)$,
> $T_3 \leftarrow T_3 \oplus F_1(RK_{2(r-i)-1}, T_2)$
>   *Step 2.2* $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow T_3 \mid T_0 \mid T_1 \mid T_2$
> *Step 3.* $Y_0 \mid Y_1 \mid Y_2 \mid Y_3 \leftarrow T_1 \mid T_2 \mid T_3 \mid T_0$

3.1 F-functions

Two F-functions F_0 and F_1 used by $GFN_{d,r}$ are defined as follows:

$F_0 : (RK_{(32)}, x_{(32)}) \mapsto y_{(32)}$

> *Step 1.* $T \leftarrow RK \oplus x$
> *Step 2.* Let $T = T_0 \mid T_1 \mid T_2 \mid T_3$, $T_i \in \{0,1\}^8$
> $T_0 \leftarrow S_0(T_0)$,
> $T_1 \leftarrow S_1(T_1)$,
> $T_2 \leftarrow S_0(T_2)$,
> $T_3 \leftarrow S_1(T_3)$
> *Step 3.* Let $y = y_0 \mid y_1 \mid y_2 \mid y_3$, $y_i \in \{0,1\}^8$
> $^t(y_0, y_1, y_2, y_3) = M_0 \; ^t(T_0, T_1, T_2, T_3)$

$F_1 : (RK_{(32)}, x_{(32)}) \mapsto y_{(32)}$

> *Step 1.* $T \leftarrow RK \oplus x$
> *Step 2.* Let $T = T_0 \mid T_1 \mid T_2 \mid T_3$, $T_i \in \{0,1\}^8$
> $T_0 \leftarrow S_1(T_0)$,
> $T_1 \leftarrow S_0(T_1)$,
> $T_2 \leftarrow S_1(T_2)$,
> $T_3 \leftarrow S_0(T_3)$
> *Step 3.* Let $y = y_0 \mid y_1 \mid y_2 \mid y_3$, $y_i \in \{0,1\}^8$
> $^t(y_0, y_1, y_2, y_3) = M_1 \; ^t(T_0, T_1, T_2, T_3)$

S_0 and S_1 are nonlinear 8-bit S-boxes, and M_0 and M_1 are 4×4 matrices defined later in this section. In each F-function, two S-boxes are used in the different order, and different matrix is used. Figure 1 shows the construction of the F-functions.

3.2 S-boxes

CLEFIA employs two different types of 8-bit S-boxes: one is based on four 4-bit random S-boxes, and the other is based on the inverse function over $GF(2^8)$.

Tables 1 and 2 show the output values of S_0 and S_1, respectively. In these tables all values are expressed in a hexadecimal form. For an 8-bit input
Figure 1: F-functions

of an S-box, the upper 4-bit indicates a row and the lower 4-bit indicates a column. For example, if a value `0xab` is input, `0x7e` is output by S_0 because it is on the cross line of the row indexed by 'a.' and the column indexed by '.b'.

3.2.1 S_0

S_0 is generated by combining four 4-bit S-boxes SS_0, SS_1, SS_2 and SS_3 in the following way. The values of these S-boxes are defined as Table 3.

$$S_0 : \begin{cases} \{0,1\}^8 & \rightarrow & \{0,1\}^8 \\ x_{(8)} & \mapsto & y_{(8)} \end{cases}$$

Step 1. $t_0 \leftarrow SS_0(x_0), \quad t_1 \leftarrow SS_1(x_1)$, where $x = x_0\|x_1, \ x_i \in \{0,1\}^4$
Step 2. $u_0 \leftarrow t_0 \oplus \mathtt{0x2} \cdot t_1, \quad u_1 \leftarrow \mathtt{0x2} \cdot t_0 \oplus t_1$
Step 3. $y_0 \leftarrow SS_2(u_0), \quad y_1 \leftarrow SS_3(u_1)$, where $y = y_0\|y_1, \ y_i \in \{0,1\}^4$

The multiplication in $\mathtt{0x2} \cdot t_i$ is performed in GF(2^4) defined by the lexicographically first primitive polynomial $z^4 + z + 1$. Figure 2 shows the construction of S_0.

Figure 2: S_0

3.2.2 S_1

S_1 is defined as follows:

$$S_1 : \begin{cases} \{0,1\}^8 & \rightarrow & \{0,1\}^8 \\ x_{(8)} & \mapsto & y_{(8)} \end{cases}$$

$$y = \begin{cases} g(f(x)^{-1}) & \text{if} \ \ f(x) \neq 0 \\ g(0) & \text{if} \ \ f(x) = 0 \end{cases} .$$

The inverse function is performed in GF(2^8) defined by a primitive polynomial $z^8 + z^4 + z^3 + z^2 + 1$. $f(\cdot)$ and $g(\cdot)$ are affine transformations over GF(2), which are defined as follows.

$$f : \begin{cases} \{0,1\}^8 & \rightarrow & \{0,1\}^8 \\ x_{(8)} & \mapsto & y_{(8)} \end{cases}$$

$$\begin{pmatrix} y_0 \\ y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \\ y_6 \\ y_7 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 0 & 1 & 0 & 1 & 1 & 1 & 0 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \\ x_6 \\ x_7 \end{pmatrix} + \begin{pmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 1 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$g : \begin{cases} \{0,1\}^8 & \rightarrow & \{0,1\}^8 \\ x_{(8)} & \mapsto & y_{(8)} \end{cases}$$

10

$$\begin{pmatrix} y_0 \\ y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \\ y_6 \\ y_7 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \\ x_6 \\ x_7 \end{pmatrix} + \begin{pmatrix} 0 \\ 1 \\ 1 \\ 0 \\ 1 \\ 0 \\ 0 \\ 1 \end{pmatrix}$$

Here, $x = x_0|x_1|x_2|x_3|x_4|x_5|x_6|x_7$ and $y = y_0|y_1|y_2|y_3|y_4|y_5|y_6|y_7$, $x_i, y_i \in \{0, 1\}$. The constants in f and g can be represented as `0x1e` and `0x69`, respectively.

3.3 Diffusion Matrices

Two matrices M_0 and M_1 are defined as follows.

$$M_0 = \begin{pmatrix} \texttt{0x01} & \texttt{0x02} & \texttt{0x04} & \texttt{0x06} \\ \texttt{0x02} & \texttt{0x01} & \texttt{0x06} & \texttt{0x04} \\ \texttt{0x04} & \texttt{0x06} & \texttt{0x01} & \texttt{0x02} \\ \texttt{0x06} & \texttt{0x04} & \texttt{0x02} & \texttt{0x01} \end{pmatrix}, \quad M_1 = \begin{pmatrix} \texttt{0x01} & \texttt{0x08} & \texttt{0x02} & \texttt{0x0a} \\ \texttt{0x08} & \texttt{0x01} & \texttt{0x0a} & \texttt{0x02} \\ \texttt{0x02} & \texttt{0x0a} & \texttt{0x01} & \texttt{0x08} \\ \texttt{0x0a} & \texttt{0x02} & \texttt{0x08} & \texttt{0x01} \end{pmatrix}.$$

The multiplications of a matrix and a vector are performed in GF(2^8) defined by the lexicographically first primitive polynomial $z^8 + z^4 + z^3 + z^2 + 1$.

4   Data Processing Part

4.1   Overall Structure

The data processing part of CLEFIA consists of ENC_r for encryption and DEC_r for decryption. ENC_r and DEC_r are based on the 4-branch generalized Feistel structure $GFN_{4,r}$. Let $P, C \in \{0,1\}^{128}$ be a plaintext and a ciphertext, and let $P_i, C_i \in \{0,1\}^{32}$ $(0 \leq i < 4)$ be divided plaintext and ciphertext where $P = P_0|P_1|P_2|P_3$ and $C = C_0|C_1|C_2|C_3$, and let $WK_0, WK_1, WK_2, WK_3 \in \{0,1\}^{32}$ be whitening keys and $RK_i \in \{0,1\}^{32}$ $(0 \leq i < 2r)$ be round keys provided by the key scheduling part. Then, r-round encryption function ENC_r is defined as follows:

$$ENC_r : \begin{cases} \{\{0,1\}^{32}\}^4 \times \{\{0,1\}^{32}\}^{2r} \times \{\{0,1\}^{32}\}^4 \to \{\{0,1\}^{32}\}^4 \\ (WK_{0(32)}, \ldots, WK_{3(32)}, RK_{0(32)}, \ldots, RK_{2r-1(32)}, P_{0(32)}, \ldots, P_{3(32)}) \\ \qquad\qquad \mapsto C_{0(32)}, \ldots, C_{3(32)} \end{cases}$$

Step 1. $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow P_0 \mid (P_1 \oplus WK_0) \mid P_2 \mid (P_3 \oplus WK_1)$
Step 2. $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow GFN_{4,r}(RK_0, \ldots, RK_{2r-1}, T_0, T_1, T_2, T_3)$
Step 3. $C_0 \mid C_1 \mid C_2 \mid C_3 \leftarrow T_0 \mid (T_1 \oplus WK_2) \mid T_2 \mid (T_3 \oplus WK_3)$

The decryption function DEC_r is defined as follows:

$$DEC_r : \begin{cases} \{\{0,1\}^{32}\}^4 \times \{\{0,1\}^{32}\}^{2r} \times \{\{0,1\}^{32}\}^4 \to \{\{0,1\}^{32}\}^4 \\ (WK_{0(32)}, \ldots, WK_{3(32)}, RK_{0(32)}, \ldots, RK_{2r-1(32)}, C_{0(32)}, \ldots, C_{3(32)}) \\ \qquad\qquad \mapsto P_{0(32)}, \ldots, P_{3(32)} \end{cases}$$

Step 1. $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow C_0 \mid (C_1 \oplus WK_2) \mid C_2 \mid (C_3 \oplus WK_3)$
Step 2. $T_0 \mid T_1 \mid T_2 \mid T_3 \leftarrow GFN_{4,r}^{-1}(RK_0, \ldots, RK_{2r-1}, T_0, T_1, T_2, T_3)$
Step 3. $C_0 \mid C_1 \mid C_2 \mid C_3 \leftarrow T_0 \mid (T_1 \oplus WK_0) \mid T_2 \mid (T_3 \oplus WK_1)$

Figure 3 illustrates both of ENC_r and DEC_r.

4.2   The Numbers of Rounds

The number of rounds, r, is 18, 22 and 26 for 128-bit, 192-bit and 256-bit keys, respectively. The total number of RK_i depends on the key length. The data processing part requires 36, 44 and 52 round keys for 128-bit, 192-bit and 256-bit keys, respectively.
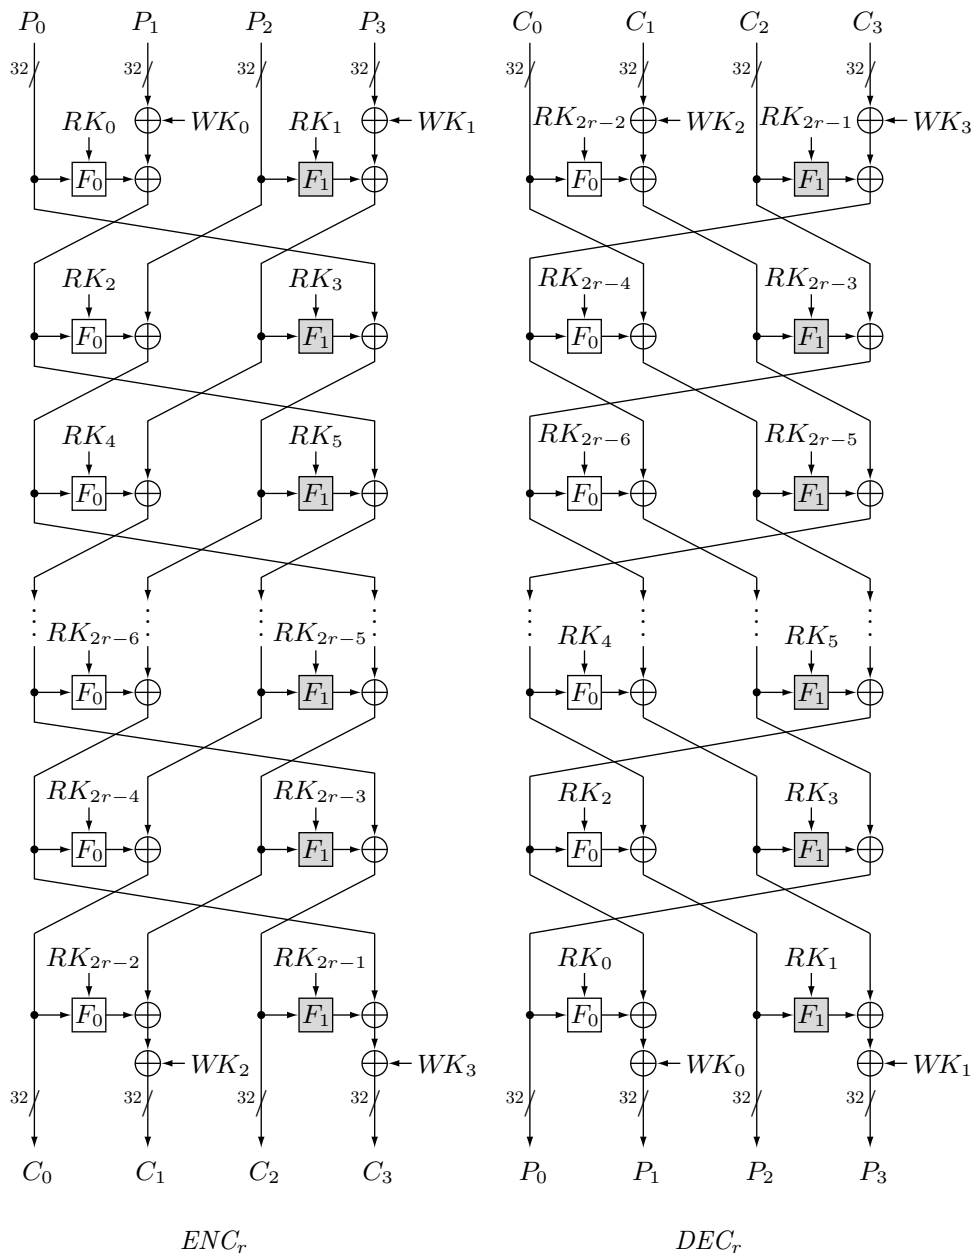

Figure 3: Structures of Data Processing Part

5   Key Scheduling Part

The key scheduling part of CLEFIA supports 128, 192 and 256-bit keys and outputs whitening keys WK_i $(0 \leq i < 4)$ and round keys RK_j $(0 \leq j < 2r)$ for the data processing part. We first define the *DoubleSwap* function which is used in the key scheduling part.

Definition 1 *The DoubleSwap Function* Σ
The DoubleSwap function $\Sigma : \{0,1\}^{128} \to \{0,1\}^{128}$ *is defined as follows:*

$$X_{(128)} \mapsto Y_{(128)}$$
$$Y = X[7-63] \mid X[121-127] \mid X[0-6] \mid X[64-120] \ ,$$

where $X[a-b]$ *denotes a bit string cut from the a-th bit to the b-th bit of* X. *0-th bit is the most significant bit.*

The DoubleSwap function is illustrated in Fig 4.
Figure 4: DoubleSwap Function Σ

5.1   Overall Structure

The key scheduling part of CLEFIA provides whitening keys and round keys for the data processing part. Let K be the key and L be an intermediate key, and the key scheduling part consists of the following two steps.

1. Generating L from K.

2. Expanding K and L (Generating WK_i and RK_j).

To generate L from K, the key schedule for a 128-bit key uses a 128-bit permutation $GFN_{4,12}$, while the key schedules for 192/256-bit keys use a 256-bit permutation $GFN_{8,10}$.

5.2   Key Scheduling for a 128-bit Key

The 128-bit intermediate key L is generated by applying $GFN_{4,12}$ which takes twenty-four 32-bit constant values $CON_i^{(128)}$ $(0 \leq i < 24)$ as round

© 2007 Sony Corporation   14

keys and $K = K_0|K_1|K_2|K_3$ as an input. Then K and L are used to generate WK_i $(0 \leq i < 4)$ and RK_j $(0 \leq j < 36)$ in the following steps. In the latter part, thirty-six 32-bit constant values $CON_i^{(128)}$ $(24 \leq i < 60)$ are used. The generation steps of $CON_i^{(128)}$ are explained in Sect 5.5.

(Generating L from K)

Step 1. $L \leftarrow GFN_{4,12}(CON_0^{(128)}, \ldots, CON_{23}^{(128)}, K_0, \ldots, K_3)$

(Expanding K and L)

Step 2. $WK_0|WK_1|WK_2|WK_3 \leftarrow K$

Step 3. For $i = 0$ to 8 do the following:
$T \leftarrow L \oplus (CON_{24+4i}^{(128)} \mid CON_{24+4i+1}^{(128)} \mid CON_{24+4i+2}^{(128)} \mid CON_{24+4i+3}^{(128)})$
$L \leftarrow \Sigma(L)$
if i is odd: $T \leftarrow T \oplus K$
$RK_{4i}|RK_{4i+1}|RK_{4i+2}|RK_{4i+3} \leftarrow T$

Figure 5 shows the relationship between generated round keys and related data.

Figure 5: Expanding K and L (128-bit key)

5.3   Key Scheduling for a 192-bit Key

Two 128-bit values K_L, K_R are generated from a 192-bit key $K = K_0|K_1|K_2|K_3|K_4|K_5$, $K_i \in \{0,1\}^{32}$. Then two 128-bit values L_L, L_R are generated by applying $GFN_{8,10}$ which takes $CON_i^{(192)}$ $(0 \leq i < 40)$ as round keys and $K_L|K_R$ as a 256-bit input. Figure 6 shows the construction of $GFN_{8,10}$.

Then K_L, K_R and L_L, L_R are used to generate WK_i $(0 \leq i < 4)$ and RK_j $(0 \leq j < 44)$ in the following steps. In the latter part, forty-four 32-bit constant values $CON_i^{(192)}$ $(40 \leq i < 84)$ are used.
The following steps show the 192-bit/256-bit key scheduling. For the 192-bit key scheduling, the value of k is set as 192.

(Generating L_L, L_R from K_L, K_R for a k-bit key)

Step 1. Set $k = 192$ or $k = 256$

Step 2. If $k = 192$: $K_L \leftarrow K_0|K_1|K_2|K_3, \; K_R \leftarrow K_4|K_5|\overline{K_0}|\overline{K_1}$
        else if $k = 256$: $K_L \leftarrow K_0|K_1|K_2|K_3, \; K_R \leftarrow K_4|K_5|K_6|K_7$

Step 3. Let $K_L = K_{L0}|K_{L1}|K_{L2}|K_{L3}, \;\; K_R = K_{R0}|K_{R1}|K_{R2}|K_{R3}$
      $L_L|L_R \leftarrow$
         $GFN_{8,10}(CON_0^{(k)}, \ldots, CON_{39}^{(k)}, K_{L0}, \ldots, K_{L3}, K_{R0}, \ldots, K_{R3})$

(Expanding K_L, K_R and L_L, L_R for a k-bit key)

Step 4. $WK_0|WK_1|WK_2|WK_3 \leftarrow K_L \oplus K_R$

Step 5. For $i = 0$ to 10 (if $k = 192$), or 12 (if $k = 256$) do the following:
    If $(i \bmod 4) = 0$ or 1:
        $T \leftarrow L_L \oplus (CON_{40+4i}^{(k)} \mid CON_{40+4i+1}^{(k)} \mid CON_{40+4i+2}^{(k)} \mid CON_{40+4i+3}^{(k)})$
        $L_L \leftarrow \Sigma(L_L)$
        if i is odd: $T \leftarrow T \oplus K_R$
    else:
        $T \leftarrow L_R \oplus (CON_{40+4i}^{(k)} \mid CON_{40+4i+1}^{(k)} \mid CON_{40+4i+2}^{(k)} \mid CON_{40+4i+3}^{(k)})$
        $L_R \leftarrow \Sigma(L_R)$
        if i is odd: $T \leftarrow T \oplus K_L$
    $RK_{4i}|RK_{4i+1}|RK_{4i+2}|RK_{4i+3} \leftarrow T$

Figure 7 shows the relationship between generated round keys and related data.

5.4   Key Scheduling for a 256-bit Key

The key scheduling for a 256-bit key is almost the same as that for 192-bit key, except for constant values, required number of RK_i, and initialization of K_R.

For a 256-bit key, the value of k is set as 256, and the steps are almost the same as in the 192-bit key case. The difference is that we use $CON_i^{(256)}$ $(0 \leq i < 40)$ as round keys to generate L_L and L_R, and then to generate RK_j $(0 \leq j < 52)$, we use fifty-two 32-bit constant values $CON_i^{(256)}$ $(40 \leq i < 92)$.

Figure 8 shows the relationship between generated round keys and related data.

5.5   Constant Values

32-bit constant values $CON_i^{(k)}$ are used in the key scheduling algorithm. We need 60, 84 and 92 constant values for 128, 192 and 256-bit keys, respectively. Let $\mathbf{P}_{(16)} = \texttt{0xb7e1}$ ($= (e-2)\cdot2^{16}$) and $\mathbf{Q}_{(16)} = \texttt{0x243f}$ ($= (\pi-3)\cdot2^{16}$), where e is the base of the natural logarithm (2.71828...) and π is the circle ratio (3.14159...). $CON_i^{(k)}$, for $k = 128, 192, 256$, are generated by the following way (See Table 4 for the repetition numbers $l^{(k)}$ and the initial values $IV^{(k)}$).

> Step 1. $T_0 \leftarrow IV^{(k)}$
> Step 2. For $i = 0$ to $l^{(k)} - 1$ do the following:
> $\quad$ Step 2.1. $CON_{2i}^{(k)} \leftarrow (T_i \oplus \mathbf{P}) \mid (\overline{T_i} \lll 1)$
> $\quad$ Step 2.2. $CON_{2i+1}^{(k)} \leftarrow (\overline{T_i} \oplus \mathbf{Q}) \mid (T_i \lll 8)$
> $\quad$ Step 2.3. $T_{i+1} \leftarrow T_i \cdot \texttt{0x0002}^{-1}$

In Step 2.3, the multiplications are performed in the field $\mathrm{GF}(2^{16})$ defined by a primitive polynomial $z^{16} + z^{15} + z^{13} + z^{11} + z^5 + z^4 + 1$ ($=\texttt{0x1a831}$)[5].

Table 4: Required Numbers of Constant Values

k	# of $CON_i^{(k)}$	$l^{(k)}$	$IV^{(k)}$	
128	60	30	0x428a	($= (\sqrt[3]{2} - 1) \cdot 2^{16}$)
192	84	42	0x7137	($= (\sqrt[3]{3} - 1) \cdot 2^{16}$)
256	92	46	0xb5c0	($= (\sqrt[3]{5} - 1) \cdot 2^{16}$)

Tables 5-7 show the values of T_i, and Tables 8-12 show the values of $CON_i^{(k)}$.

---

[5]The lower 16-bit value is defined as $\texttt{0xa831}=(\sqrt[3]{101} - 4) \cdot 2^{16}$. '101' is the smallest prime number satisfying the primitive polynomial condition in this form.

6 Test Vectors

We give test vectors of CLEFIA for each key length. The data are expressed in hexadecimal form.

128-bit key:

key	ffeeddcc bbaa9988 77665544 33221100
plaintext	00010203 04050607 08090a0b 0c0d0e0f
ciphertext	de2bf2fd 9b74aacd f1298555 459494fd

192-bit key:
